

Native Networks

SMALL MODULAR AI DATACENTERS · ANDD.AI

PRODUCT GUIDE V1.0 · SEPTEMBER 2026

Products, Locations, Service Levels & Pricing

What we sell, where it runs, when it is available, what it costs, and what we commit to. Native Networks builds and operates 500 kW to 20 MW AI datacenters sited where power and fiber already exist, so inference runs locally instead of round-tripping to a distant cloud.

500 kW–20 MW	90–180 days	< 30 ms	99.99%
PER SITE, GROWN AS CONTRACTED	FROM SITE SELECTION TO LIVE	ROUND TRIP IN THE SERVICE AREA	HIGHEST CONTRACTED AVAILABILITY

FOR CUSTOMERS AND PARTNERS

Indicative pricing and service levels are current as of September 2026 and are confirmed in a written quote. Native Networks · andd.ai · contact@andd.ai

How to read this guide. Sections 1 to 11 are for customers. Section 12 is for referral, reseller, managed-service, and real-estate partners. Anything marked planned is on the roadmap and not yet orderable; anything marked indicative is confirmed in a written quote.

01 · WHAT WE SELL

1. What we sell

Native Networks sells three things that do not get cheaper as token prices fall: proximity, sovereignty, and automated operations.

We build and operate small modular AI datacenters, 500 kW to 20 MW, from two pre-engineered modules: the EC500 (500 kW) and the EC1000 (1 MW). Sites are placed where utility capacity and fiber already exist, next to the carrier, so a workload's round trip stays inside its own region. A site starts with one module and grows to 20 MW as customers contract capacity.

Customers buy the network four ways: managed inference by the token or the endpoint, dedicated or shared compute by the GPU-hour, private capacity by the kilowatt or the whole module, and optional services (storage, network, sovereign controls) attached to any of them.

Family	Products	Buy it as	Typical buyer
Managed inference	Serverless Inference, Dedicated Endpoint, Tune	Per token · per GPU-replica-hour	Developers, AI product teams, ISVs
Compute	GPU On-demand, Reserved, Spot · Bare Metal · Kubernetes · VM	Per GPU-hour or per node-hour	Platform and infrastructure teams
Private capacity	Capacity Block · Private Site (EC500 / EC1000) · Site-as-a-Service	Per kW-month · per module-month	Enterprises, carriers, utilities, public sector
Optional services	Storage · Network · Sovereign bundles · Web3 services	Attached to any product above	Any

Why local

Inference is now the majority of AI compute, and real-time voice, agentic sessions, inline security, and physical AI cannot tolerate a distant round trip. Hyperscale capacity was built for centralized training and cannot arrive in time to serve the edge. Native Networks fills that layer: capacity under 30 ms from the user, with placement, residency, and service levels you can audit.

02 · PRODUCTS

2. Products

Every product has a named SKU, a metering unit, an SLA class, and a residency capability. Quotes are generated from the same catalog you see here.

2.1 Managed inference

SKU	What you get	Included	Not included	Options
AI-Serverless	OpenAI-compatible API over a curated open-weight catalog (7B to 70B+ chat, embeddings, speech, image), routed to the nearest site with the model warm	Model hosting, autoscaling, metering, playground, usage API	Custom models, guaranteed throughput, private networking	Std (best effort) · Metro (latency-pinned, p99 SLA) · Resident (jurisdiction-pinned, attested) · Batch (24 h window, half price)
AI-Dedicated	Single-tenant endpoint on named GPUs: catalog model or your own weights and LoRA adapters; guaranteed tokens/sec and p99 latency; autoscaling floor and ceiling; placement control	GPUs, serving stack, monitoring, SLA operations, private endpoint	Model licences you do not hold, application code	Edge or Hub placement · Confidential (attested confidential computing, +15–25%) · private interconnect
AI-Tune (planned)	Managed fine-tuning (SFT, DPO, LoRA) and mid-scale training with one-click deploy to a Dedicated Endpoint	Job orchestration, cost estimate before launch, output weights	Data preparation, evaluation design	Hub sites only; availability follows the first hub

2.2 Dedicated and shared compute

SKU	What you get	Tenancy	Billing	Notes
CMP-GPU On-demand	Whole GPUs on Blackwell-class racks, per-minute billing	Dedicated GPU, shared site	Per GPU-hour	No commitment
CMP-GPU Reserved	The same GPUs at a 1- or 3-year commitment	Dedicated GPU, shared site	Per GPU-hour, discounted 25–50%	Resource or spend commit
CMP-GPU Spot	Preemptible GPUs at 60–75% off with a 2-minute reclaim notice	Dedicated GPU while held	Per GPU-minute	Best for batch and CI
CMP-Metal	Dedicated bare-metal servers, customer-managed OS	Single tenant	Per node-hour or node-month	Successor product for displaced Equinix Metal customers
CMP-K8s / CMP-VM	Managed Kubernetes namespaces, scale-to-zero containers, x86 and Arm VMs with confidential variants	Shared with VM-grade isolation	Per vCPU-hour, per 100 ms container	Untrusted tenants never share a GPU

2.3 Private capacity

SKU	What you get	Term	Billing
NOD-Capacity Block	Reserved kilowatts and GPU mix at a named site or region; quarterly flex of 15% either way without an	12–60 months	Fixed $/kW-month plus usage at deep discount

SKU	What you get	Term	Billing
	amendment		
NOD-Private Site	A whole EC500 or EC1000 module operated for one customer, on our site or on your campus (hospital, utility, carrier)	36–60 months, take-or-pay	One-time site charge plus module-month
NOD-Site-as-a-Service	White-label capacity for carriers and municipalities: your brand, our fabric, portal, and API	5–10 years	Revenue share or wholesale
NOD-Fractional	A guaranteed slice of a site, 25% and up	12–36 months	Per kW-month

2.4 Optional services

Line	SKUs	What it adds
Storage (STO)	Object (S3-compatible, erasure-coded across 3+ sites, 11-nines durability) · Block (NVMe) · File (NFS/SMB) · Archive · Backup · Resident variants	Data next to the GPUs; residency pinned per bucket; egress at $0.01/GB or less, free inside the fabric
Network (NET)	Private interconnect (10/100 GbE ports) · Carrier-neutral peering · Metro wavelengths · CDN with AI response cache · Zero-trust mesh VPN	Direct paths into your premises and into cloud on-ramps (AWS, Azure, GCP) at hub sites
Sovereign (SOV)	Compliance bundles (FedRAMP Moderate, CJIS, HIPAA, ITAR; sold only once the authorization exists) · Secure cage · Air-gap site · NG911 continuity · Model enclave	Control sets wrapped around any base SKU, with boundary documentation and continuous-monitoring feeds your auditors can subscribe to
Web3 (DPN)	Validator hosting with anti-correlation placement · Managed RPC · Verifiable compute · Programmable SLA API	Machine-readable pricing, telemetry, and settlement for protocols that need datacenter-grade reliability

03 · TECHNICAL CAPABILITIES

3. Technical capabilities

Launch sites run NVIDIA GB200 NVL72-class racks. The platform is silicon-agnostic by design, so the fleet can add AMD Instinct and inference-specific accelerators as they qualify.

Capability	Specification
Accelerators	GB200 NVL72-class racks: 72 Blackwell GPUs and 36 Grace CPUs per rack, about 13 TB of HBM per rack, NVLink-connected as one domain. Three racks per EC500, six per EC1000. Whole-GPU tenancy is the minimum unit for any customer; fractional sharing only inside one customer's own workloads
CPU and memory	Grace Arm cores paired to each GPU; x86 and Arm general-purpose nodes for VMs, containers, and bare metal, 256 GB to 1 TB DDR5 per node
Storage	NVMe hot tier and QLC warm tier per site; object storage erasure-coded across three or more sites once a region has three sites; archive on HDD with 12-hour retrieval

Capability	Specification
Networking	400 GbE inside the site; carrier-adjacent siting removes the backhaul hop; bonded fiber backhaul of 10 to 100 Gbps with Starlink as a diverse backup; carrier-neutral peering at hub sites
Supported models	Curated open-weight catalog per site (5 to 8 models kept warm): Llama, Qwen, DeepSeek, Mistral, and Gemma-class chat models from 7B to 70B+, embeddings, speech-to-text, and image models. Bring your own weights and LoRA adapters on Dedicated Endpoints
Software and frameworks	OpenAI-compatible inference API; vLLM and SGLang-class serving; Kubernetes with GPU operator; S3-compatible storage API; REST and gRPC capacity API; Terraform and Pulumi providers; Kubernetes CRDs for GPU pools, endpoints, and residency policy
Confidential computing	AMD SEV-SNP and Intel TDX attested VMs; GPU confidential-computing mode for attested inference (planned for hub sites)
Workload limits	Serverless rate limits by tier (20, 600, 6,000 requests per minute; custom above); context length per model card; Spot reclaim notice of 2 minutes; cold starts apply to scale-to-zero tiers, and the warm tier is priced separately

04 · DEPLOYMENT AND TENANCY

4. Deployment and tenancy

Choose the scope (one site or many), the hardware boundary (dedicated or shared), and who operates what.

Option	Choices	What it means
Scope	Single-site · Multi-site (metro pair) · Multi-region	Single-site carries a 99.9% SLA. A diversity-audited metro pair with automated failover carries 99.99%. Multi-region adds cross-site routing and residency per region
Hardware	Dedicated GPU · Dedicated server · Dedicated module · Shared with VM-grade isolation	GPUs are never shared across customers. Shared applies only to CPU containers and VMs, isolated at the VM level
Operations	Fully managed · Customer-managed	Fully managed covers hardware lifecycle, firmware and drivers, the serving stack, monitoring, patching, capacity management, and SLA operations. Customer-managed (Bare Metal, bring-your-own Kubernetes) covers the hardware, power, network, and site; you run the OS and above
Placement	Any site · Named metro · Named jurisdiction · Named site	Placement is enforced by the scheduler and, for Resident SKUs, attested per request or per object

What fully managed includes

Hardware procurement, spares, and refresh · Firmware, drivers, and serving-stack updates · 24/7 monitoring and the SLA guardian that reroutes and fails over before a breach · Security patching and vulnerability management · Capacity planning and expansion in 500 kW or 1 MW steps · Usage

metering, invoicing, and automatic SLA credits.

Not included: your application code, model licences you do not already hold, and the classification and legal basis of your data.

05 · LOCATIONS AND AVAILABILITY

5. Locations and availability

Four launch sites in the United States and the United Kingdom, each 500 kW and expandable to 20 MW. The land-to-power pipeline exceeds 1 GW.

Site	Region	Status	Initial capacity	Expansion	Provisioning
Phoenix	Arizona, US	Launch site (pilot)	EC500, 500 kW	To 20 MW as contracted	Existing capacity under 30 days; new module 90–180 days
Dallas	Texas, US	Launch site (pilot)	EC500, 500 kW	To 20 MW as contracted	Same
Newcastle	North East England, UK	Launch site (pilot)	EC500, 500 kW	To 20 MW as contracted	Same
Leeds	Yorkshire, UK	Launch site (pilot)	EC500, 500 kW	To 20 MW as contracted	Same
Next 30 US states	20 MW per state	Planned	EC500 or EC1000 first module	To 20 MW per state	Anchor commitment opens the site; live 90–180 days from site selection
Further UK regions	By demand	Planned	EC500	To 20 MW	Same

Status definitions. *Pilot*: the site is contracted and in build or acceptance; pilot customers run on beta terms with credits capped at one month of fees. *Live*: general availability with the full SLA schedule. *Planned*: on the pipeline; capacity can be reserved with a creditable deposit and a delivery-date SLA, but is not yet orderable on demand.

Provisioning times. Serverless: minutes. Dedicated Endpoint or GPU on an existing site: same day to 1 business day. Capacity Block on an existing site: under 30 days. New module or new site: 90 to 180 days from site selection, with the date committed in the contract. Live capacity and the maintenance calendar are published on the status page.

06 · DISTRIBUTED CAPABILITIES

6. Distributed capabilities

The network is one fabric. You choose where a workload may run; the scheduler chooses the best site inside that boundary and moves work when a site degrades.

Capability	How it works	Available from
Location selection	Pick any site, a named metro, a named jurisdiction (state, county, or country), or a specific site. Latency service areas are published from measured data, not drawn as circles	Launch
Workload routing	Serverless requests go to the nearest site with the model warm. Dedicated Endpoints stay where you pinned them. Anycast front doors in metros with three or more sites	Launch; anycast with metro density
Regional capacity allocation	Capacity Blocks reserve kilowatts per site or per region; quarterly flex of 15% either way through the portal without an amendment	Launch
Failover	Metro pairs fail over automatically in under 30 seconds after a diversity audit and drills; cross-region failover for Platinum class	Metro pairs as they qualify
Runs locally	Real-time inference, dedicated endpoints, hot storage, private interconnect, public-safety and sovereign workloads pinned in-jurisdiction	Launch
Runs across sites	Batch inference, spot capacity, geo-erasure-coded object storage, backup, fine-tuning and large-model serving at hub sites, cross-site failover	As each region reaches three sites

The value compounds with density. One site gives you proximity. A metro pair gives you 99.99%. Three sites in a region give you anycast, geo-durable storage, and no-exclusion maintenance. Hundreds of sites per region give you the same placement, latency, and residency guarantees everywhere your users are.

07 · SERVICE LEVELS AND SUPPORT

7. Service levels and support

Service levels are gated on physical topology, not on marketing. Credits are automatic: they appear on the invoice with no claim to file.

7.1 Availability classes

Class	Monthly availability	Topology required	Default for
Best-effort	Monitored, not credited	Any	Free, Spot, Batch
Bronze	99.9%	Single site with N+1 power, dual backhaul, on-site spares	Starter

Class	Monthly availability	Topology required	Default for
Silver	99.95%	Site plus automatic metro failover	Pro
Gold	99.99%	Diversity-audited metro pair, drilled failover under 30 s	Enterprise, Dedicated Endpoints, object storage
Platinum (planned)	99.99% contracted, 99.999% measured and published	Three or more sites across metros	Sovereign bundles, NG911, Web3 backbone

7.2 Credit schedule

Breach	Bronze	Silver	Gold	Platinum
Below target, above 99.0%	10%	15%	25%	50%
Below 99.0%, above 95.0%	25%	35%	50%	100%
Below 95.0%	50%	75%	100%	100%
Latency (p99 over target by 20%+ in an hour)	n/a	5% per breach-hour, cap 20%	5% per breach-hour, cap 30%	5% per breach-hour, cap 50%
Confirmed data loss (object storage)	12 months of storage fees for the affected data			
Residency boundary violation	100% of the monthly charge for the resource, and notification within 24 hours			

Credits are a percentage of the affected resource's monthly charge. Pilot sites run on beta terms: 99.9% target, credits capped at one month of fees. Availability and latency are measured by Native Networks probes and gateway telemetry, co-signed by an independent probe vendor; the methodology and raw data are published on the status page and never restated.

7.3 Other commitments

Dimension	Commitment
Latency	p99 network round trip of 30 ms or less inside a site's published service area; 10 ms or less inside the metro polygon; time-to-first-token targets per model class on Dedicated Endpoints
Throughput	Contracted tokens per second floor on Dedicated Endpoints
Durability	11 nines for object storage once erasure-coded across three sites
Recovery	RPO 15 minutes and RTO 4 hours for managed storage and platform services
Delivery dates	Contracted go-live date on Capacity Blocks and Private Sites, with liquidated damages for delay
Maintenance	Pilot and single sites: one weekly window (Tuesday 02:00–06:00 local), excluded from the SLA. Metro pairs: rolling zero-downtime updates, no exclusion

7.4 Support

Plan	Hours	Severity 1 response	Severity 2 / 3	Escalation
Free	Community and AI assistant	Best effort	Best effort	None
Starter	AI assistant 24/7, email in business hours	24 hours	2 business days / 5 business days	Support lead
Pro	24/7	1–4 hours, human	8 hours / next business day	Support lead, then service delivery manager
Enterprise	24/7 with a named technical account contact	1 hour	4 hours / next business day	Named contact, service delivery manager, VP Operations
Government	24/7, cleared personnel where required	15 minutes	1 hour / 4 hours	Contractual escalation matrix

Severity 1 is a production outage or SLA breach in progress; Severity 2 is degraded production; Severity 3 is a non-production issue or question. Status, incidents, and credits paid to date are public on the status page.

08 · SECURITY AND SOVEREIGNTY

8. Security and sovereignty

Residency is a scheduler rule, not a consulting engagement. You choose the boundary and receive an attestation that the workload stayed inside it.

Control	What you get
Access control	SSO (SAML, OIDC), role-based access, per-project API keys with scopes and expiry, hardware-key MFA for administrators, full audit log exportable to your SIEM
Encryption	TLS 1.3 in transit; AES-256 at rest with per-tenant keys; customer-managed keys on Enterprise and Government plans; attested confidential VMs and, at hub sites, confidential GPU mode for the Confidential variants
Data ownership	Your data, prompts, outputs, and weights are yours. Native Networks does not train on customer data and does not access it except to operate the service under your instruction
Retention and deletion	You set retention per bucket and per endpoint; logs default to 30 days. On termination, an export window is guaranteed before cryptographic erasure, and erasure is certified in writing
Geo-pinning	Placement by metro, state, county, or country; attested per request (inference) or per object (storage); any confirmed boundary violation pays a full-month credit and is disclosed within 24 hours
Tenancy isolation	Whole-GPU tenancy for every customer; VM-grade isolation for shared CPU tiers; dedicated cages and air-gapped sites for sovereign workloads
Personnel	Background-checked operations staff; citizenship and clearance guarantees inside sovereign bundles; every automated action runs through a policy engine with typed, audited, reversible steps

Control	What you get
Compliance roadmap	SOC 2 Type I in the first year of operation, then Type II; FedRAMP Moderate, CJIS, HIPAA, and ITAR bundles are sold only after the authorization exists. Until then, the compliance evidence pack is available on request

09 · CUSTOMER PROPOSITION

9. Customer proposition

Use Native Networks where the round trip is the problem: real-time AI, regulated data, and services that have to keep running when the wide-area network does not.

Use case	Why local	Product fit
Real-time and agentic AI	Voice, copilots, and multi-step agents feel broken above a few tens of milliseconds	Serverless Metro, Dedicated Endpoint
Fraud and risk scoring	Sub-50 ms decision budgets and state-level residency for financial data	Dedicated Confidential, Resident storage, private interconnect
Healthcare imaging and clinical AI	PHI stays in-jurisdiction; imaging inference near the scanner	Dedicated Endpoint, HIPAA bundle (as authorized), Private Site on campus
Public safety and NG911	Call routing, transcription, and video analytics must survive a backhaul partition	NG911 continuity, Private Site, air-gap option
Physical AI and mobility	Vehicle and robot loops need single-digit milliseconds at the roadside	Metro-pinned endpoints at carrier-adjacent sites
Carrier and MEC services	Sell edge AI to your enterprise base on your own brand	Site-as-a-Service, wholesale
Utilities and grid	Substation-adjacent compute for SCADA, forecasting, and demand response	Private Site, Capacity Block
Web3 infrastructure	Validators that are provably not co-located; settlement and SLAs a protocol can compose	Validator hosting, programmable SLA API

What scale buys you

Proximity. Hundreds of sites per region put the same catalog within 30 ms of every user, not only those near a hyperscale campus.

Latency you can contract. Metro-pinned classes carry a credited p99 latency SLA; no hyperscale region offers one.

Sovereignty by default. Residency is a placement rule on every SKU, so a new jurisdiction is a checkbox, not a project.

Resilience. Sites peer with neighbors; a metro pair reaches 99.99%, and a region with three sites

keeps serving through maintenance and a site loss.

Cost. Modules cost about half the capital per megawatt of a hyperscale build and are live in 90 to 180 days, and egress stays at $0.01/GB or less.

10 · INTEGRATION AND ONBOARDING

10. Integration and onboarding

Most customers change one base URL. The rest follow a five-step path with a fixed acceptance test at the end.

10.1 Interfaces

Interface	Detail
Inference API	OpenAI-compatible endpoints (chat, embeddings, audio, images); drop-in for LiteLLM, LangChain, and vLLM clients; per-request placement headers
Capacity API	REST and gRPC (v1, additive-only): sites, offers, reservations, dedicated endpoints; Kubernetes CRDs for GPU pools, endpoints, and residency policy
Storage API	S3-compatible with a published compatibility matrix; block via CSI; residency policy set at bucket or volume creation
Billing and usage API	Line-item usage events, hourly rollups, invoices, budgets and alerts, and a machine-readable price sheet; signed usage exports for audit
Portal and concierge	Web portal for projects, keys, placement, spend caps, and SLA telemetry; a conversational concierge that quotes live prices and can provision below $250k of contract value
Infrastructure as code	Terraform and Pulumi providers; Kubernetes-native lifecycle for bring-your-own clusters

10.2 Onboarding path

01 **Sign up and place.** Self-serve account with an instant API key, or an enterprise agreement e-signed with the security questionnaire pre-answered. Choose placement and spend caps.

02 **Trial or pilot.** 14-day trial with $500 in credits for self-serve customers. Paid pilots of $10k to $50k, fixed scope, for enterprise and public-sector customers; pilot fees credit against the first-year commitment.

03 **Migrate.** Migration assistance is included on Pro and above: endpoint mapping, model parity testing, data transfer with free ingress, and parallel-run support. Interconnect ordered in step 1 lands before cut-over.

04 **Accept.** The acceptance test below is run jointly and signed off.

05 **Operate.** Production service levels start at acceptance; the named contact and escalation path are active from day one.

10.3 Acceptance criteria (pilot and production)

Criterion	Measured as	Pass
Latency	p99 network round trip from the customer's named endpoints inside the service area over 7 days	At or below the contracted figure
Availability	Measured availability over the pilot period	At or above the class target
Throughput	Sustained tokens per second on the Dedicated Endpoint at the contracted concurrency	At or above the contracted floor
Placement	Residency attestations for a sample of requests and objects	100% inside the boundary
Failover (metro pair)	Drilled loss of one site	Recovery under 30 seconds, no data loss
Billing	Usage report reconciles to the customer's own counts	Within 0.1%

11 · PRICING AND COMMERCIAL TERMS

11. Pricing and commercial terms

List prices are public and machine-readable. Discounts buy commitment or term. The figures below are indicative for September 2026 and are confirmed in a written quote.

11.1 Charging units and indicative list rates (USD)

Product	Unit	Indicative list	Modifiers
Serverless, small models (up to 8B)	Per 1M tokens, blended	$0.10–0.15	Metro +15–40% · Resident +20–30% · Batch −50% · cached input discounted
Serverless, mid models (9B–34B)	Per 1M tokens, blended	$0.30–0.50	Same
Serverless, large models (35B–72B)	Per 1M tokens, blended	$0.85–1.00	Same
GPU On-demand, GB200-class	Per GPU-hour	$4.50	Confidential +15–25%
GPU Reserved, 1 year	Per GPU-hour	$3.15 (about 30% off)	Resource or spend commit
GPU Reserved, 3 years	Per GPU-hour	$2.50 (about 45% off)	
GPU Spot	Per GPU-minute	60–75% off on-demand	2-minute reclaim
Full NVL72 rack, reserved	Per rack-month	About $165k (1 year) · $130k (3 years)	72 GPUs; on-demand equivalent about $235k
Capacity Block	Per kW-month	Quoted per site	5-year anchor terms typically 40–55% below list
Private Site, EC500	Per module-month	Quoted; anchor pricing	36–60 months, take-or-pay floor of 70–85%
Object storage	Per GB-month	Parity with hyperscale	Resident +25–40% · Archive about

Product	Unit	Indicative list	Modifiers
		standard tiers	one fifth
Egress	Per GB	$0.01 or less; free inside the fabric	Ingress free
Interconnect port	Per port-month	Quoted (10 GbE, 100 GbE)	One-time cross-connect charge

11.2 Plans

	Free	Starter	Pro	Enterprise	Government
Platform fee	$0	$49 / month	$499 / month	Custom annual, about $60k minimum	Per contract vehicle
Included credits	$5, expiring	$60	$650	Negotiated pool	Negotiated
Serverless rate limit	20 RPM	600 RPM	6,000 RPM	Custom	Custom
Products	Serverless, pay as you go	Adds Kubernetes, VM, storage, Spot, CDN	Adds Dedicated, Tune, Reserved, interconnect, Web3	Adds private capacity, wavelengths, white-label	Adds all sovereign SKUs
Default SLA class	Best-effort	Bronze	Silver	Gold	Gold or Platinum track
Residency pinning	None	Metro	State	State or county, attested	Full sovereign controls
Billing	Prepaid only	Monthly card or ACH, net 30	Monthly or annual, ACH or wire	Annual, net 45–60	Per procurement, multi-year

11.3 Commitments, minimums, and overages

Term	Detail
Minimum commitment	None on pay-as-you-go. Enterprise plans start at about $60k per year. Capacity Blocks run 12 to 60 months; Private Sites 36 to 60 months with a 70–85% take-or-pay floor and a remarketing clause that credits back half the proceeds of resold capacity
Contract lengths	Monthly (Starter, Pro), annual (Enterprise), 1- and 3-year reserved, 5-year and longer anchor agreements
Reservation options	Prepaid credit packs (5–15% off by size, 12-month expiry) · Reserved 1 or 3 years (25–35% and 40–50% off) · Capacity Block with 15% quarterly flex · Forward capacity options (3–8% of strike, callable and tradeable back)
Setup fees	None for self-serve and Dedicated Endpoints. One-time charges apply to interconnect cross-connects and to Private Sites
Overages	Metered at list after included credits. Alerts at 50, 75, 90, and 100% of budget with one-click actions: raise the cap, buy a credit pack, or convert to a commitment. Hard caps are on by default for Free and Starter; Pro and above get anomaly detection that pauses runaway spend pending confirmation
Annual prepay	15–20% off the platform fee and committed usage

Term	Detail
Marketplaces (planned)	Private offers on AWS, Azure, and GCP marketplaces so committed cloud spend can be applied to Native Networks capacity

11.4 Worked examples

Customer	Configuration	Indicative monthly	Notes
Developer	Serverless, 50M tokens per month on an 8B model, Metro placement	$8	$0.12 per 1M tokens plus a 30% Metro uplift; no platform fee on Free
AI startup	Pro plan; Dedicated Endpoint on 2 GB200-class GPUs, 1-year reserved; 2 TB object storage	About $5,500	2 × $3.15 × 730 h = $4,600; Pro $499; storage about $40; Silver SLA with automatic credits
Regional bank	Enterprise plan; one NVL72 rack, 1-year reserved, state-pinned Resident placement; 100 GbE interconnect; 50 TB Resident object storage	About $175,000	Rack about $165k; platform about $5k; storage about $1.5k; interconnect quoted; Gold SLA where a metro pair exists
Anchor tenant	Private Site EC500 (3 racks, 216 GPUs) on a 5-year take-or-pay at anchor pricing of $2.50 per GPU-hour	About $395,000	About $4.7M per year; 80% floor gives a $3.8M minimum; delivery-date SLA with liquidated damages; expansion rights to further modules

All figures exclude taxes and are illustrative. Serverless token prices track the open-model market and are updated on the public price sheet; GPU and capacity prices are held for the contract term.

12 · PARTNER PROGRAM

12. Partner program

For CBRE and other real-estate, channel, and technology partners. Every partner deal keeps the zero-touch model: partners sell with our concierge and portal under their own brand, and inherit the same automatic SLA credits.

12.1 Commercial framework

Model	Who it suits	Economics	Ownership and billing
Referral	Advisors, brokers, and consultancies that introduce qualified opportunities	Referral fee of 5–10% of first-year contract value (proposed), paid on the customer's first invoice	Native Networks contracts and bills the customer; the partner keeps referral rights on renewals for 24 months
Reseller	Carriers, MSPs, SIs, and VARs that own the customer relationship	20–35% off list, tiered by committed annual volume	Partner paper with flow-down terms; partner is customer of record, bills the end customer, and provides first-line support
Managed service (white-label)	Carriers and MSPs selling edge AI under their own brand	Reseller pricing plus a licence for the white-label portal and onboarding concierge	Partner owns the account, renewals, and billing; Native Networks operates the fabric and honours the SLA to the partner
Site and real-estate partner	Owners and operators contributing land, power, fiber, or anchor demand	Revenue share of 10–25% of site net revenue for 5–10 years, scaled to the contribution; or a fixed ground lease	Native Networks contracts with tenants; the partner receives a quarterly statement and share

Rule	Detail
Eligibility	Signed partner agreement, one accredited seller, and one technical contact; annual recertification
Deal registration	Register the named account in the partner portal; registration protects the opportunity for six months and is renewable while active
Account ownership	The registering partner owns the opportunity. Referral accounts belong to Native Networks; reseller and managed-service accounts belong to the partner
Renewals	Reseller and managed-service partners retain renewals while in good standing; referral fees continue for the first two renewal cycles
Contracting	Referral: Native Networks paper. Reseller and managed service: partner paper with the Native Networks flow-down schedule (SLA, acceptable use, residency, data terms)
Rules of engagement	No resale into US federal agencies without Native Networks compliance sign-off. Standard-class capacity may not be resold as guaranteed-latency service. List prices are public; reservation floors are not to be disclosed

12.2 Sales enablement

Topic	Detail
Ideal customer profiles	AI product companies with real-time users in a metro we serve; regulated enterprises (financial services, healthcare) with residency obligations; carriers and utilities with sites and power; state and local government with public-safety workloads; Web3 protocols that need reliable, provably distributed infrastructure
Qualification questions	Where are your users, and what latency budget do they have? What data must stay in which jurisdiction? What is your current GPU spend and utilization? Do you need dedicated hardware or a shared endpoint? When do you need capacity, and for how long? Who signs, and on what paper?
Approved claims	500 kW to 20 MW sites from EC500 and EC1000 modules · Live in 90 to 180 days · Under 30 ms round trip in the service area · No community water draw and minimal noise · About half the capital per megawatt of hyperscale, five to ten times faster · Automatic SLA credits, no claims process · More than 1 GW of land-to-power pipeline
Claims not approved	Five-nines contracts · FedRAMP, CJIS, HIPAA, or ITAR authorization before it is granted · Capacity dates at planned sites without a signed reservation · Any statement that Standard-class capacity carries a latency SLA
Solution examples	Dedicated Endpoint for a voice agent in Dallas · Resident inference and storage for a bank in Arizona · Private Site on a hospital campus · Site-as-a-Service for a regional carrier · Capacity Block anchoring a new state site
Quotation process	Partner portal generates list and partner-net quotes from the live catalog in minutes; opportunities above $250k of contract value get a Native Networks solutions lead; anchor and site deals go through the capacity desk
Training and presales	Half-day seller accreditation and one-day technical accreditation, both online; shared demo environment; presales engineers on request through the portal with a one-business-day response

12.3 Delivery responsibilities

Scope	Native Networks	Technology partners	Customer or partner of record
Site, power, interconnect	Selects, contracts, and operates; utility and fiber agreements	Site owners contribute land, power, or fiber under a site agreement	None (Private Site on customer campus: provides the site and utility feed)
Modules, foundations, cooling	Designs, procures, installs, and maintains	Module and precast manufacturers build to specification	None
GPUs, servers, network hardware	Procures, operates, refreshes, holds spares	NVIDIA, AMD, and OEM supply and warranty	None
Platform software and serving stack	Operates the fabric, scheduler, serving, metering, and SLA guardian	Open-source and vendor components under Native Networks support contracts	Customer-managed tiers: OS and above on Bare Metal and bring-your-own Kubernetes
Models and weights	Curated open-weight catalog with licences that permit commercial serving	Model publishers and marketplaces	Own weights, adapters, and any licence they require
Licences	OS, virtualization, and serving-stack licences included in	Vendors	Application, database, and third-

Scope	Native Networks	Technology partners	Customer or partner of record
	managed tiers		party model licences
Application management	None	SIs and MSPs under their own contracts	Owns application code, deployment, and change management
Monitoring and SLA operations	24/7 monitoring, failover, credits	Independent probe vendor co-signs measurements	Monitors its own application; consumes telemetry APIs
Security	Physical, platform, and tenancy isolation; compliance evidence	Attestation and key-management vendors	Identity, data classification, workload security, and legal basis for data
Support and billing	Direct customers: support and invoicing. Partners: second-line support and partner billing	Vendor escalation	Reseller and managed-service partners: first-line support and end-customer billing
