THE OFFERING IN ONE PAGE

Compute within 10 milliseconds, sovereignty by construction, operated end to end by AI.

ANDD is a mesh of sub-2MW edge datacenters in Opportunity Zone metros, run by autonomous AI agents at a ratio of one human per 20-50 sites. We sell the three things that don't deflate as token prices fall: **milliseconds, jurisdiction, and reliability**. Tokens bring customers onto the network; locality, sovereignty, and self-executing SLAs carry the margin.

Proximity

Heavy GPUs under 10ms from mid-size metros. No provider prices latency by geography today; AWS's 25% Local Zone uplift proves buyers pay for it.

Sovereignty

Jurisdiction-pinned placement is a signup checkbox: attested residency, compliance bundles, survive-in-place autonomy.

Zero-touch operations

The AI that runs the datacenters runs the funnel: quote to provisioned workload in minutes, every deal under $250k TCV closed without a human.

WHAT WE SELL

8 lines · ~40 SKU families

Inference & AI services — AI

OpenAI-compatible serverless tokens in Standard, Metro (latency SLA, +15-40%), Resident (jurisdiction-pinned, +20-30%), and Batch (half price); dedicated endpoints; fine-tuning at hubs.

Compute — CMP

GPU-hours (on-demand, reserved -30-55%, spot -60-75%), managed K8s, VMs, containers, and bare metal aimed at the customers Equinix Metal orphaned in June 2026.

Storage — STO

S3-compatible object across 3+ nodes (11-nines durability), attested residency pinning (+25-40%), block, file, archive, backup. Egress at $0.01/GB or less, always.

Network — NET

Private interconnect, carrier-neutral peering, metro wavelengths, CDN with semantic AI-response caching, zero-trust mesh VPN.

Sovereign & government — SOV

Secure cages, FedRAMP/CJIS/HIPAA/ITAR bundles (+15-35%), air-gapped survive-in-place nodes, NG911 continuity per PSAP, sovereign model enclaves.

DePIN & Web3 — DPN

Anti-correlated validator hosting, verifiable compute with TEE attestations, and programmable SLAs whose stablecoin credits cascade into a protocol's own commitments.

Whole-node — NOD

Node leases, private nodes on customer campuses, Node-as-a-Service for telcos (white-label) and municipalities (QOF-financeable, 5-10-year terms), fractional nodes.

Marketplace — MKT

Prepaid credits (card, ACH, USDC; provisioned within one block confirmation), per-call pay-as-you-go with no minimum, a public spot exchange, and a model hub.

HOW BUYING WORKS

discover · sign up · consume

Discover

Developers arrive through model hubs, framework adapters, and latency benchmarks. Off-takers and agencies arrive through marketplace private offers, NASPO ValuePoint, and anchor-tenant site launches.

`List prices public & machine-readable`

Sign up

The AI Concierge quotes live prices and runs KYC/KYB in minutes. A binding off-taker term sheet (sites, kW, delivery dates, take-or-pay) is drafted by the negotiation agent in days.

`Zero-touch under $250k TCV`

Consume

One meter, one ledger, many rails: prepaid, NET-30/60 invoicing, or USDC channels settling per epoch. Overage alerts at 50/75/90/100% with hard caps by default on small tiers.

`TTFW: dev <3 min · DePIN <1 hr · muni 90 days`

SLAS & BILLING

gated by physics, enforced by code

Every SLA is code. Credits land automatically, with no claims process; breach telemetry is co-signed by an independent probe vendor. Tiers are gated on node density per metro: one node contracts 99.9%, a diversity-audited metro pair 99.99%, and five nines is published as measured, never contracted.

BRONZE	SILVER	GOLD	PLATINUM
99.9	99.95	99.99	99.99+
single node	metro failover	multi-node metro	multi-metro mesh

Commercial engine. Every node launches 40-60% pre-sold to anchor tenants before ground-break; with breakeven near 23-25% utilization, nodes are cash-positive at acceptance. Reserved off-take anchors the balance sheet, vertical commits fund nodes, and spot usage fills the remaining hours. Discounts only ever buy commitment or term: 1-year commits save 25-35%, 3-year 40-50%.

ROADMAP

off-take, then verticals, then spot; the last two may swap

Anchor off-take, prove ops — MO 1-12

- 3-5 pilot sites; serverless + dedicated GA; classic auto-credit SLAs
- AI onboarding agent GA; SOC 2 Type I; two strategic anchors (NG911 county, fintech)

`$25-45M run rate · 30-50 nodes`

Verticals: add depth — MO 12-24

- Hubs: 70B serving, fine-tuning; stablecoin rail; 99.99% metro SKUs
- DePIN APIs; marketplace listings; NASPO listing; FedRAMP in assessment

`$120-200M run rate · 100-150 nodes`

Spot: open the market — MO 24-36

- Smart-contract SLA GA; micro-channels; confidential computing GA
- FedRAMP ATO opens federal; whole-node & telco NaaS; capacity-market APIs

`$350-550M run rate · 250-300 nodes`

23-25%	40-60%	<3 min	60%	$1B+
