THE OFFERING AND THE OPENING

Compute within 10 milliseconds, sovereignty by construction, operated end to end by AI.

ANDD is a mesh of sub-2MW edge datacenters in Opportunity Zone metros, run by autonomous AI agents at a ratio of one human per 20-50 sites. Token prices have fallen roughly 99% since 2023 and keep falling, so we never anchor margin to $/token. The durable premiums attach to what does not deflate: **milliseconds (physics), jurisdiction (law), reliability (engineering), and compliance (regulation)**. Tokens bring customers onto the network; locality, sovereignty, and self-executing SLAs carry the margin.

Proximity

Heavy GPUs under 10ms from mid-size metros, sold as a priced, SLA-backed tier. No provider prices latency by geography today.

Sovereignty

Jurisdiction-pinned placement as a checkbox: attested residency, compliance bundles, air-gap and survive-in-place autonomy.

Zero-touch operations

The AI that runs the datacenters runs the funnel: quote to provisioned workload in minutes, every deal under $250k TCV closed without a human.

THE MARKET OPENING

live comparables, August 2026

ANDD DIFFERENTIATOR	STATE OF THE MARKET	THE OPPORTUNITY
Latency	Serverless pricing ignores geography; AWS Local Zones charge +25% with thin GPU inventory; Cloudflare edge serves small models only	The only heavy-GPU capacity under 10ms from mid-size metros; a Metro tier at +25-40%
SLAs	Lambda and RunPod publish no numeric SLA; best in class is 99.9-99.99% with manual claims	Oracle-fed credits that pay automatically; no competitor offers this
Dedicated capacity	Equinix Metal, the best API-provisioned bare metal, shut down June 30, 2026	A displaced buyer cohort in-market right now
Reliability + crypto rails	DePIN runs 60-80% below AWS but tops out near 99.7% uptime; Akash GPU supply fell over 57% QoQ	DePIN-grade settlement on datacenter-grade infrastructure; QOF-financed supply that doesn't churn with a token
Gov procurement	FedRAMP 20x fast-track began March 2026; NASPO ValuePoint gives states and counties RFP-free purchasing	The only sub-10ms GPU capacity on a pre-competed cooperative contract

DEMAND TAILWIND

why now

OF A MODEL'S LIFETIME COMPUTE SPEND IS INFERENCE

WHAT WE SELL

8 lines · ~40 SKU families

Inference & AI services — AI

OpenAI-compatible serverless tokens in Standard, Metro (latency SLA, +15-40%), Resident (jurisdiction-pinned, +20-30%), and Batch (half price); dedicated endpoints with commit discounts to 40%; fine-tuning at hubs.

Compute — CMP

GPU-hours (reserved -30-55%, spot -60-75% with 2-minute reclaim), managed K8s, scale-to-zero containers, VMs, and the bare metal SKU aimed at Equinix Metal's orphaned customers.

Storage — STO

S3-compatible object erasure-coded across 3+ nodes (11-nines durability), attested residency pinning (+25-40%), block, file, archive, backup. Egress at $0.01/GB or less, free intra-fabric.

Network — NET

Private interconnect into premises and cloud on-ramps, carrier-neutral peering, metro wavelengths, CDN with semantic AI-response caching, zero-trust mesh VPN.

Sovereign & government — SOV

Secure cages, FedRAMP/CJIS/HIPAA/ITAR bundles (+15-35%) sold only after authorization exists, air-gapped survive-in-place nodes, NG911 continuity per PSAP, sovereign model enclaves.

DePIN & Web3 — DPN

Anti-correlated validator hosting, verifiable compute with TEE attestations, and programmable SLAs whose stablecoin credits cascade into a protocol's own token-holder commitments.

Whole-node — NOD

Node leases (36-60 months, build-to-suit with take-or-pay), private nodes on customer campuses, Node-as-a-Service for telcos and municipalities, fractional nodes.

Marketplace — MKT

Prepaid credits (card, ACH, USDC provisioned within one block), per-call pay-as-you-go with no minimum, a public machine-readable spot exchange, and a model hub.

HOW EACH CUSTOMER BUYS

discover · sign up · consume · grow

PERSONA	IN THE DOOR	SIGNUP	FIRST WORKLOAD	GROWS INTO
Spot developer	Model hubs, framework adapters, latency benchmarks, hackathon credits	GitHub OAuth or wallet; $5 free credits, no card	< 3 min	Auto-top-up, Starter, dedicated endpoints
Startup	Accelerator credit programs, Terraform registries	Self-serve org; KYB in minutes; credits auto-adjudicated	< 1 day prod	Agent-proposed commits, multi-metro
Fintech / mid-market	Residency content, core-banking ISV partners	Sandbox same day; security questionnaire auto-answered in hours	< 2 weeks	Per-state residency, custom models, multi-year commits
Off-taker	Exec origination, cloud-marketplace private offers, wholesale desks	Binding term sheet drafted by the negotiation agent in days	< 30 days	Metro clusters, statewide footprints, 15% quarterly flex
Government	NASPO ValuePoint, FedRAMP Marketplace, OTAs, SI primes	Compliance agent auto-generates SSPs and control matrices	< 60 days pilot	County PSAP to statewide NG911 to federal after ATO
DePIN project	Governance forums, on-chain SLA registry	Wallet auth plus automated KYB; pay USDC, provision in one block	< 1 hour	Protocol backbone; their users consume ANDD inference
Municipality	OZ development offices, groundbreaking press	Council approval, QOF financing, AI-drafted grant applications	90 days	County clusters; the town becomes a channel

SLAS & BILLING

gated by physics, enforced by code

Every SLA is code. Credits land automatically with no claims process, and breach telemetry is co-signed by an independent probe vendor, so customers audit us rather than trust us. Tiers are gated on node density per metro: a single node contracts 99.9%, a diversity-audited metro pair 99.99%, and five nines is published as measured, never contracted in this horizon. Latency SLAs cover p99 within published service polygons drawn from measured data.

BRONZE	SILVER	GOLD	PLATINUM
99.9	99.95	99.99	99.99+
single node	metro failover	multi-node metro	multi-metro mesh

One meter, one ledger, many rails. Every product emits signed usage events into one metering pipeline; the billing agent settles across prepaid credits, NET-30/60 invoicing, and USDC channels settling per epoch. A live risk score sets prepaid or postpaid automatically; collections run AI-automated through day 60. Overage alerts fire at 50/75/90/100% with hard caps default-on for small tiers. Cloud-marketplace private offers let enterprises spend committed hyperscaler budgets on ANDD.

THE COMMERCIAL ENGINE

reservations anchor, commits fund, usage fills

Anchor-tenant node launches. Every node opens its anchor book at site shortlisting: 40-60% of capacity pre-sold before ground-break at the best pricing that node will ever see (typically 45-55% off list, 5-year terms), with delivery-date SLAs enforced by the same smart-contract machinery. A half-pre-sold node presents to QOF investors as contracted infrastructure, which lowers the cost of capital. The remaining capacity is the high-margin merchant layer.

Unit economics, 300kW inference node (about $8M all-in, roughly 180 L40S-class accelerators): breakeven near 23-25% utilization; cash margin 43% at 40% utilization, 60% at 60%, 68% at 80%. GAAP profitability arrives around 45-50% utilization. Blended gross margin runs 45-50% in Phase 2 toward 60%+ at maturity. Commit discounts: 1-year 25-35%, 3-year 40-50%; take-or-pay floors at 70-85% with a remarketing clause.

ROADMAP

off-take, then verticals, then spot; the last two may swap

Anchor off-take, prove ops — MO 1-12

- 3-5 pilot sites; serverless + dedicated endpoints GA; metering pipeline first (it blocks every consumption SKU)
- AI onboarding agent GA; classic auto-credit SLAs; SOC 2 Type I; two strategic anchors (NG911 county, design-partner fintech)

$25-45M run rate · 30-50 nodes

Verticals: add depth — MO 12-24

- Hubs unlock 70B serving and fine-tuning; stablecoin rail GA; 99.99% SKUs in diversity-audited metros
- DePIN APIs with 2-3 protocols; marketplace private offers; NASPO listing; FedRAMP boundary in assessment

$120-200M run rate · 100-150 nodes

Spot: open the market — MO 24-36

- Smart-contract SLA GA after 2 audits and 4 clean quarters; micro-transaction channels; confidential computing GA
- FedRAMP ATO opens federal; whole-node and telco NaaS; capacity-market APIs

$350-550M run rate · 250-300 nodes

OPERATING DOCTRINE

the ten commercial rules

01 No ground-break below 40% pre-commit coverage.

02 The AI agent sells everything below $250k TCV end to end; humans advise, they don't gatekeep.

03 Publish list prices, machine-readable; never publish reservation floors.

04 Discounts buy commitment or term, never given without one.

05 Premium tiers are fenced by guarantees and placement rights, never by throttling the cheap tier's quality.

06 Stablecoin settlement for DePIN always; native tokens never as payment.

07 Every SLA is code; every credit is automatic; every performance record is public.

08 Egress stays cheap forever. It is the moat-builder against hyperscaler lock-in.

09 DePIN revenue capped near 15% of mix; gov mix grows only as fast as certifications.

10 Every partner deal must inherit zero-touch economics or it dilutes the model.

23-25%	40-60%	115-125%	60%	$1B+
NODE BREAKEVEN UTILIZATION	CAPACITY PRE-SOLD AT GROUND-BREAK	NET REVENUE RETENTION TARGET	NEW ARR ZERO-TOUCH BY MONTH 36	CONTRACTED BACKLOG TARGET, TCV
