01 · WHY WE WIN

Compute within 10 milliseconds, sovereignty by construction, operated end to end by AI.

ANDD is a mesh of sub-2MW edge datacenters in Opportunity Zone metros, run by autonomous AI agents at a ratio of one human per 20-50 sites. Token prices have fallen roughly 99% since 2023 and keep falling, so we never anchor margin to $/token. The durable premiums attach to what does not deflate: **milliseconds (physics), jurisdiction (law), reliability (engineering), and compliance (regulation)**. Tokens bring customers onto the network; locality, sovereignty, and self-executing SLAs carry the margin.

Proximity

Heavy GPUs under 10ms from mid-size metros, sold as a priced, SLA-backed tier. No provider prices latency by geography today.

Sovereignty

Jurisdiction-pinned placement as a checkbox: attested residency, compliance bundles, air-gap and survive-in-place autonomy.

Zero-touch operations

The AI that runs the datacenters runs the funnel: quote to provisioned workload in minutes, every deal under $250k TCV closed without a human.

THE MARKET OPENING

live comparables, August 2026

ANDD DIFFERENTIATOR	STATE OF THE MARKET	THE OPPORTUNITY
Latency	Serverless pricing ignores geography; AWS Local Zones charge +25% with thin GPU inventory; Cloudflare edge serves small models only	The only heavy-GPU capacity under 10ms from mid-size metros; a Metro tier at +25-40%
Sovereignty	Hyperscalers put hardware on the customer's premises and budget (Outposts, Azure Local, GDC); DePIN can't say where a workload ran	Residency as a product feature, not a consulting engagement
SLAs	Lambda and RunPod publish no numeric SLA; best in class is Baseten 99.99% and Fireworks 99.9%, both with manual claims	Oracle-fed credits that pay automatically; no competitor offers this
Dedicated capacity	Equinix Metal, the best API-provisioned bare metal, shut down June 30, 2026	A displaced buyer cohort in-market right now
Reliability + crypto rails	DePIN runs 60-80% below AWS but tops out near 99.7% uptime; Akash GPU supply fell over 57% QoQ as token rewards tightened	DePIN-grade settlement on datacenter-grade infrastructure; QOF-financed supply that doesn't churn with a token
Gov procurement	FedRAMP 20x fast-track began March 2026; NASPO ValuePoint gives states and counties RFP-free purchasing	The only sub-10ms GPU capacity on a pre-competed cooperative contract
Micro-billing	Per-token pricing exists but settlement doesn't; card-based prepaid breaks down for agentic and IoT per-request payment	Payment channels settling fractions of a cent per request

DEMAND TAILWIND

why now

2/3
OF ALL AI COMPUTE IS NOW INFERENCE (WAS 1/3 IN 2023)

$30-37B
EDGE AI MARKET IN 2026, GROWING 22-29% CAGR

$100B+
PROJECTED EDGE AI MARKET BY 2030

80-90%
OF A MODEL'S LIFETIME COMPUTE SPEND IS INFERENCE

WHAT COULD BREAK IT

top risks, engineered against

R1 **Edge GPU multi-tenancy.** Whole-GPU or MIG tenancy only in year 1; VM isolation for every untrusted tenant.

R2 **Serverless cold starts on small pools.** Curated 5-8 model catalogs; every model warm somewhere under 2ms away; warm and flex tiers priced separately.

R3 **Metering accuracy.** Signed idempotent events, dual-path counting, drift alerts below 0.1%. Under-bill on ambiguity, always.

R4 **Oracle trust.** Two-of-two attestation with an independent probe vendor; on-chain credits only after 4 clean quarters and 2 audits.

R5 **Fictional backhaul diversity at OZ sites.** Conduit-level path verification before signing; sites that fail the audit sell uptime-only SKUs.

R6 **FedRAMP calendar.** Small boundary, StateRAMP revenue in parallel, and no revenue plan keyed to ATO dates.

THE CATALOG

8 lines · ~40 SKU families

Inference & AI services — AI

OpenAI-compatible serverless tokens in Standard, Metro (latency SLA, +15-40%), Resident (jurisdiction-pinned, +20-30%), and Batch (half price). Dedicated endpoints on named GPUs with guaranteed tokens/sec (commits save 20-40%). Fine-tuning at hubs with conversational job launch.

Compute — CMP

GPU-hours on-demand, reserved (-30-55%), spot (-60-75%, 2-minute reclaim, the mechanism that monetizes idle capacity), and MIG fractions. Managed K8s, scale-to-zero containers, VMs, and bare metal aimed at Equinix Metal's orphaned customers.

Storage — STO

S3-compatible object erasure-coded across 3+ nodes (11-nines durability, gated on node count), attested residency pinning (+25-40%), block, file, archive at a fifth of object price, managed backup. Egress at $0.01/GB or less, free intra-fabric.

Network — NET

Private interconnect into premises and cloud on-ramps (AWS DX, Azure ER, GCP), carrier-neutral peering, metro wavelengths, CDN with semantic AI-response caching, zero-trust mesh VPN across a customer's footprint.

Sovereign & government — SOV

Secure cages (12-60-month terms), FedRAMP/CJIS/HIPAA/ITAR bundles (+15-35%) sold only after the authorization exists, air-gapped survive-in-place nodes with SCIF options, NG911 continuity per PSAP, sovereign model enclaves with attested no-egress.

DePIN & Web3 — DPN

Validator hosting with anti-correlation guarantees (no two validators share a node or power region), managed RPC, verifiable compute with TEE attestations, and programmable SLAs (5% attach) whose stablecoin credits cascade into a protocol's own commitments.

Whole-node — NOD

Node leases (36-60 months, build-to-suit with take-or-pay), private nodes on hospital, utility, and campus sites, Node-as-a-Service for telcos (white-label, MEC-ready) and municipalities (QOF-financeable, 5-10-year terms), fractional nodes from 25%.

Marketplace — MKT

Prepaid credits from $5 to $50k (card, ACH, USDC provisioned within one block), per-call pay-as-you-go with no subscription or minimum, a public machine-readable spot exchange, and in Phase 3 a model hub (ANDD takes 15-20%) and agent-template store.

TIERS

platform fee unlocks limits, SLA, support; usage meters on top

	FREE	STARTER	PRO	ENTERPRISE	GOV
Platform fee	$0	$49/mo	$499/mo	~$60k/yr min	Contract vehicle
Default SLA	Best-effort	Bronze 99.9%	Silver 99.95%	Gold 99.99%	Gold / Platinum-track
Auto-credit SLA	None	Attach option	Attach option	Included	Included where permitted
Residency	None	Metro	State	State/county + attestation	Full sovereign controls
Billing	Prepaid only	Monthly, NET 30	Monthly/annual	Annual, NET 45-60	Per procurement

THE COMMITMENT LADDER

discounts only ever buy commitment or term

INSTRUMENT	TERM	DISCOUNT	MECHANICS
Prepaid credit packs	12-mo expiry	5-15%	Fiat or USDC in one conversational turn; breakage is margin
Committed-use	1 yr / 3 yr	25-35% / 40-50%	Commit dollars, not hardware; the agent auto-proposes from telemetry and executes below $250k TCV
Capacity Block	12-60 mo	custom floor	Reserved kW plus GPU mix at named nodes; 15% quarterly flex via the negotiation agent
Take-or-pay	24-60 mo	floor pricing	70-85% floor billed regardless; remarketing clause resells unconsumed capacity into spot, half the proceeds credited back
Build-to-suit	36-120 mo	contracted	NRC plus node-month; the floor covers financing; QOF-structurable
Forward options	6-36 mo	3-8% of strike	Callable future capacity, tradeable back to ANDD

PRICING POSTURE

premium where physics and law bind, parity on commodities

LINE	POSTURE	ANCHOR
Serverless tokens	Aggressive, bottom quartile	Llama-8B-class around $0.10-$0.15/M tokens; a loss leader that fills idle capacity and feeds the funnel
Metro / Resident tiers	Premium +20-40%	Mirrors AWS's proven 25% Local Zone uplift; competitors can't follow without pouring concrete
Dedicated endpoints	Platform parity	L40S at $1.90-$2.40/hr, H100-class at $3.50-$4.50/hr, with locality and the auto-credit SLA included
Sovereign / compliance	Premium +20-100%	Still cheaper all-in than Outposts or GDC, because the customer buys no hardware
Storage & egress	Parity; egress ≤$0.01/GB	Cheap egress is the switching incentive, and edge cost structure sustains it

HOW EACH CUSTOMER BUYS

discover · sign up · consume · grow

PERSONA	IN THE DOOR	SIGNUP	FIRST WORKLOAD	GROWS INTO
Spot developer	Model hubs, framework adapters, latency benchmarks, hackathon credits	GitHub OAuth or wallet; $5 free credits, no card	< 3 min	Auto-top-up, Starter, dedicated endpoints
Startup	Accelerator credit programs, Terraform registries	Self-serve org; KYB in minutes; credits auto-adjudicated	< 1 day prod	Agent-proposed commits, multi-metro
Fintech / mid-market	Residency content, core-banking ISV partners	Sandbox same day; security questionnaire auto-answered in hours	< 2 weeks	Per-state residency, custom models, multi-year commits
Off-taker	Exec origination, cloud-marketplace private offers, wholesale desks	Binding term sheet drafted by the negotiation agent in days	< 30 days	Metro clusters, statewide footprints, 15% quarterly flex
Government	NASPO ValuePoint, FedRAMP Marketplace, OTAs, SI primes	Compliance agent auto-generates SSPs and control matrices	< 60 days pilot	County PSAP to statewide NG911 to federal after ATO
DePIN project	Governance forums, on-chain SLA registry	Wallet auth plus automated KYB; pay USDC, provision in one block	< 1 hour	Protocol backbone; their users consume ANDD inference
Municipality	OZ development offices, groundbreaking press	Council approval, QOF financing, AI-drafted grant applications	90 days	County clusters; the town becomes a channel

SLAS & BILLING

gated by physics, enforced by code

Every SLA is code. Credits land automatically with no claims process; breach telemetry is co-signed by an independent probe vendor, so customers audit us rather than trust us. Tiers are gated on node density: one node contracts 99.9%, a diversity-audited metro pair 99.99%, and five nines is published as measured, never contracted in this horizon. Confirmed data loss pays 12 months of storage fees; a residency violation pays 100% of the monthly charge.

BRONZE	SILVER	GOLD	PLATINUM
99.9	99.95	99.99	99.99+
single node	metro failover	multi-node metro	multi-metro mesh

One meter, one ledger, many rails. Signed usage events feed one metering pipeline; the billing agent settles across prepaid credits, NET-30/60 invoicing, and USDC channels settling per epoch. A live risk score sets prepaid or postpaid automatically; collections run AI-automated through day 60 (DSO under 35 days, bad debt under 0.5%). Marketplace private offers let enterprises spend committed hyperscaler budgets on ANDD; a NASPO listing makes every municipality an eligible buyer.

THE COMMERCIAL ENGINE

reservations anchor, commits fund, usage fills

Anchor-tenant node launches. Every node opens its anchor book at site shortlisting: 40-60% of capacity pre-sold before ground-break at the best pricing that node will ever see (typically 45-55% off list, 5-year terms), with delivery-date SLAs enforced by the smart-contract machinery. A half-pre-sold node presents to QOF investors as contracted infrastructure, lowering the cost of capital. The rest is the high-margin merchant layer sold through PLG and commits.

300KW NODE, ~$8M ALL-IN	40% UTIL	60% UTIL	80% UTIL
Monthly revenue	$168k	$252k	$336k
Node cash margin	$73k (43%)	$151k (60%)	$229k (68%)
Cash-on-cash yield	11%	23%	34%

ROADMAP

off-take, then verticals, then spot; the last two may swap

Anchor off-take, prove ops — MO 1-12

- 3-5 pilot sites; serverless + dedicated endpoints GA; metering pipeline first (it blocks every consumption SKU)
- AI onboarding agent GA; classic auto-credit SLAs; SOC 2 Type I; two strategic anchors (NG911 county, design-partner fintech)

$25-45M run rate · 30-50 nodes

Verticals: add depth — MO 12-24

- Hubs unlock 70B serving and fine-tuning; stablecoin rail GA; 99.99% SKUs in diversity-audited metros
- DePIN APIs with 2-3 protocols; marketplace private offers; NASPO listing; FedRAMP boundary in assessment

$120-200M run rate · 100-150 nodes

Spot: open the market — MO 24-36

- Smart-contract SLA GA after 2 audits and 4 clean quarters; micro-transaction channels; confidential computing GA
- FedRAMP ATO opens federal; whole-node and telco NaaS; capacity-market APIs

$350-550M run rate · 250-300 nodes

OPERATING DOCTRINE

the ten commercial rules

01 No ground-break below 40% pre-commit coverage.
02 The AI agent sells everything below $250k TCV end to end; humans advise, they don't gatekeep.
03 Publish list prices, machine-readable; never publish reservation floors.
04 Discounts buy commitment or term, never given without one.
05 Premium tiers are fenced by guarantees and placement rights, never by throttling the cheap tier's quality.
06 Stablecoin settlement for DePIN always; native tokens never as payment.
07 Every SLA is code; every credit is automatic; every performance record is public.
08 Egress stays cheap forever. It is the moat-builder against hyperscaler lock-in.
09 DePIN revenue capped near 15% of mix; gov mix grows only as fast as certifications.
10 Every partner deal must inherit zero-touch economics or it dilutes the model.

23-25%	40-60%	115-125%	60%	$1B+
NODE BREAKEVEN UTILIZATION	CAPACITY PRE-SOLD AT GROUND-BREAK	NET REVENUE RETENTION TARGET	NEW ARR ZERO-TOUCH BY MONTH 36	CONTRACTED BACKLOG TARGET, TCV
